

My name is Paul Malmgren and I live in
Bismarck, ND. I am against HB17-1124

As of current time the information necessary for
cities or counties to protect their citizens dis

respectfully moderate and would propose that
without the ability and time required to develop

and finalize studies concerning the urban
process of hydraulic fracturing not just

production, this bill would be an absolute
injustice to the health, safety and property

rights of citizens of Colorado

I submit a study from the Journal of Real Estate
Literature by experts at the University of

Texas and Colorado State University of
study shows a reduction in bird deaths per

homer located in proximity to fracking
decreases by 5% to 15%.

Paul Malmgren submitted a proposal for 139
hydraulic fracturing regulations, will take 4 to

5 years for completion based on their best
case scenario. Numerous studies show a

decrease in noise levels especially during
the installation and drilling/fracking stages

Currently, the CDPE has a multi-year study performed by researchers at the Colorado State University that determines the emissions generated during all phases of the process. The study will be used to determine the health effects concerning their operations and is expected to be completed late 2018. Of interest, the initial air pollutant emissions study showing increased pollutant emissions during each stage especially leach during many of which are known carcinogens.

of would like to take up representatives such as to fully represent the potential loss of value in my real estate value and if this bill passes I would expect a class action lawsuit for extraction oil and gas as well as the Colorado oil and gas conservation committee to provide compensation relative to my property loss based on current market value and comparative sales over the last 1 year.
